

Distinguish, differentiate, compare and explain what is the Difference between Using A Macro And Inline Function. Comparison and Differences.

Difference Between Using A Macro And Inline Function

The macro are just symbolic representations and cannot contain data type differentiation within the parameters that we give. The inline functions can have the data types too defined as a part of them. The disadvantage in using both is that the inclusion of condition checks may lead to increase in code space if the function is called many times.
